| Date          | 30 September 2026                              |
| Team ID       | SWTID-2026-9644                                |
| Project Name  | Implement Client Script & UI Policy (Incident) |
| Maximum Marks | 2 Marks                                        |

### Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

| S.No. | Parameter                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | Problem Statement<br>(Problem to be solved) | Incident records require consistent and accurate data for effective triage, routing and resolution. Relying only on user awareness and manual checks leads to incomplete, inconsistent or incorrect data, which affects reporting accuracy, SLA compliance and service quality. The project aims to enforce conditional field behavior and validation at the user interface level using ServiceNow UI Policies and Client Scripts.               |
| 2.    | Idea / Solution description                 | Implement ServiceNow UI Policies and Client Scripts on the Incident form. UI Policies make fields mandatory, visible or read-only based on conditions (for example State, Category or Priority). onLoad and onChange Client Scripts set defaults and auto-populate values. An onSubmit Client Script validates the data and prevents the record from being saved when required conditions are not met, showing clear error messages to the user. |
| 3.    | Novelty / Uniqueness                        | The solution combines UI Policies and Client Scripts in one standardized Incident form to control field behavior, auto-populate values and validate at save time. Issues are caught instantly in the form instead of after submission, reducing dependency on manual checks and ensuring a consistent data-entry experience.                                                                                                                     |
| 4.    | Social Impact / Customer Satisfaction       | Callers and agents get a guided form that shows exactly what is required, so fewer mistakes are made and less time is spent on corrections. Resolver teams receive complete and accurate Incidents, which leads to faster routing and resolution and a better service experience.                                                                                                                                                                |
| 5.    | Business Model (Revenue Model)              | For an organization, the solution reduces rework and improves data quality, SLA compliance and reporting accuracy. It is an internal process-improvement solution built on the existing ServiceNow ITSM platform using out-of-the-box client-side features, so it needs no extra licensing and is not a direct consumer product.                                                                                                                 |
| 6.    | Scalability of the Solution                 | The same approach can be extended to other tables such as Problem, Change and Service Request, and to additional fields, conditions and validation rules. It can be packaged in an update set or scoped application and reused across instances, departments and teams on the ServiceNow cloud platform.                                                                                                                                         |
