

Project Design Phase Solution Architecture

Date	30 September 2026
Team ID	SWTID-2026-9644
Project Name	Implement Client Script & UI Policy (Incident)
Team Size	3
Team Leader	Vairavakarumari A
Team Member	Abinaya K
Team Member	Kayathri Devi B
Maximum Marks	4 Marks

Solution Architecture:

The solution architecture for **Implement Client Script & UI Policy (Incident)** defines how ServiceNow client-side controls can be used to enforce data integrity on Incident records. The solution uses UI Policies and Client Scripts on the Incident form to control field visibility, mandatory status and read-only behavior, auto-populate values, and validate data before the record is submitted.

- Provide a standardized Incident form that guides callers and agents to enter complete and accurate data.
- Use UI Policies to dynamically make fields mandatory, visible, or read-only based on conditions such as State, Category, and Priority.
- Use onLoad and onChange Client Scripts to set defaults and auto-populate values as users update fields.
- Use onSubmit Client Scripts to validate data and prevent record submission when required conditions are not met.
- Display clear error and info messages so users can correct issues before saving the Incident.
- Improve data quality for triage, routing, SLA compliance, and reporting accuracy.

Example – Solution Architecture Diagram:

ServiceNow Incident - Client Script & UI Policy Flow

Figure 1: Solution architecture and data flow for Client Script and UI Policy implementation on Incident

Key Flow: Caller/Agent -> Incident form opens -> UI Policy applies field rules -> Client Scripts (onLoad/onChange) auto-populate values -> onSubmit validation -> valid Incident saved (invalid submission blocked with message) -> routing, SLA tracking, and reporting.

Technology / ServiceNow Components:

Component	Purpose
Incident Form / Form Layout	Capture incident details; the interface where client-side controls run.
UI Policy	Dynamically set fields as mandatory, visible, or read-only based on conditions.
UI Policy Actions	Apply field-level behavior when the condition is true or false.
Client Script (onLoad)	Set form defaults and initial field behavior when the form loads.
Client Script (onChange)	Auto-populate values and react when a field value changes.
Client Script (onSubmit)	Validate data at save time and stop submission if rules are not met.
g_form / g_user APIs	Client-side APIs to read, set, and control fields and show messages.
Reports / Dashboards	Monitor incident data quality, SLA compliance, and trends.
