

Project Design Phase-II

Data Flow Diagram & User Stories

Date	30 September 2026
Team ID	SWTID-2026-9644
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Data Flow Diagram:

A Data Flow Diagram (DFD) represents how information moves through the proposed Incident data-validation system. The diagram shows how a caller or agent enters Incident details, how UI Policies and Client Scripts apply field rules and validate the data on the form, and how the valid Incident is saved and routed to the resolver group.

Example: Level-0 Data Flow Diagram (Project Specific)

Level-0 Data Flow Diagram - Incident Client-Side Validation

UI Policies and Client Scripts validate data on the form before the Incident is saved and routed.

Key flow: Caller/Agent input -> UI Policy applies field rules -> Client Script auto-populates and validates -> Incident saved -> routed to resolver group.

User Stories

Use the following user stories to describe the main functional requirements of the Incident client-side validation project.

User Type	Functional Requirement (Epic)	User Story ID	User Story / Task	Acceptance criteria	Priority	Release
Caller / Agent	Incident Creation	USN-1	As a caller/agent, I can open the Incident form and see required fields clearly marked so that I enter complete details.	Required fields are marked and the Incident cannot be saved until they are filled.	High	Sprint-1
Caller / Agent	Conditional Field Behavior	USN-2	As a caller/agent, I can see fields appear, hide, or become read-only based on State, Category or Priority so that I only enter relevant data.	UI Policy changes field visibility, mandatory and read-only status when the condition is met.	High	Sprint-1
Service Desk Agent	Auto-Populate Values	USN-3	As an agent, I can have related field values auto-populated when I change a field so that manual entry and errors are reduced.	onChange Client Script fills the dependent fields correctly.	Medium	Sprint-2
Service Desk Agent	Save-time Validation	USN-4	As an agent, I receive a clear error message when I submit an Incident with missing or invalid data so that I can correct it before saving.	onSubmit Client Script blocks the save and shows a message; valid records save.	High	Sprint-1
Service Desk Manager	Data Quality Rules	USN-5	As a service desk manager, I can define the conditions under which fields become mandatory so that Incidents meet business rules.	Rules apply consistently on new and existing Incidents.	High	Sprint-1
Resolver Group	Incident Resolution	USN-6	As a resolver, I receive Incidents with complete and valid details so that I can triage and resolve them faster.	Submitted Incidents contain all required fields such as category and assignment group.	High	Sprint-2
Service Desk Agent	Resolution Closure	USN-7	As an agent, I must provide close notes and a close code when resolving an Incident so that the closure is documented.	Close code and close notes become mandatory when State is Resolved or Closed.	Medium	Sprint-2
ServiceNow Admin	Testing & Reporting	USN-8	As an admin, I can test the UI Policies and Client Scripts and review Incident records so that data quality issues are reduced.	Rules can be tested and verified; Incident records show complete data.	Low	Sprint-3

Project Goal: Enforce data integrity on Incident records using UI Policies and Client Scripts to ensure complete and valid data entry, improve processing consistency, and support accurate triage, routing, SLA compliance and reporting.
