

Ideation Phase

Empathize & Discover

Team ID	SWTID-2026-9644
Project Name	Implement Client Script & UI Policy (Incident)
Team Members	Vairavakarumari A (Team Leader), Abinaya K, Kayathri Devi B

Empathy Map Canvas

User Persona: Service desk agents and callers who log and update Incident records in ServiceNow and need complete, accurate data entry for effective triage and resolution.

SAYS - I need to log the Incident quickly. - The Incident form should be simple and clear. - I want to know which fields are required.	THINKS - Manual checks may miss errors in the data. - The same details should not have to be entered again and again. - Automatic rules can make data entry faster and more reliable.
DOES - Creates and updates Incident records. - Skips or mis-enters fields by mistake. - Gets asked for missing details and corrects records later.	FEELS - Frustrated by rework and repeated corrections. - Concerned when it is unclear which fields are required. - Satisfied when the form guides them and validates data automatically.
PAINS - Incomplete or inconsistent data entry. - Rework and delays in routing and resolution. - No real-time guidance on the form. - Errors that affect reports and SLA compliance.	GAINS - Faster, guided Incident logging. - Reduced manual effort. - Consistent and accurate data. - Clear error messages before saving. - Improved triage, routing and SLA compliance.

Goal: Understand the user's needs, frustrations, and expectations so that Incident data entry can be improved by enforcing conditional field behavior and validation using UI Policies and Client Scripts.
