

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	30 September 2026
Team ID	SWTID-2026-9644
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Incident Form Data Entry	Open the Incident form to create or update an Incident Enter caller, category, priority and description details Display required fields clearly to the user
FR-2	Conditional Field Behavior (UI Policy)	Make fields mandatory based on conditions Show or hide fields based on State, Category or Priority Set fields read-only when conditions are met
FR-3	Auto-Population (Client Script)	Set default values when the form loads (onLoad) Auto-populate dependent fields when a value changes (onChange) Reduce manual data entry errors
FR-4	Save-time Validation (Client Script)	Validate data when the Incident is submitted (onSubmit) Prevent submission if required conditions are not met Show clear error or info messages to the user
FR-5	Resolution & Data Quality	Require close code and close notes when resolving or closing Ensure Incidents are saved with complete and valid data Support accurate triage, routing, SLA tracking and reporting

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The Incident form should be simple, clear and easy for callers and agents to use, with understandable error messages.
NFR-2	Security	Incident and caller information should be protected with appropriate access controls (ACLs); client-side rules should be complemented by server-side controls where needed.
NFR-3	Reliability	UI Policies and Client Scripts should apply rules consistently and maintain accurate, complete Incident records.
NFR-4	Performance	Field changes, auto-population and validation should run instantly without slowing down the form.
NFR-5	Availability	The Incident form and its client-side controls should be available whenever callers and agents need to log or update Incidents.
NFR-6	Scalability	The solution should support more fields, conditions and users, and be extendable to other tables without major changes.
