

IDEATION PHASE

BRAINSTORM & IDEA PRIORITIZATION

Team ID	SWTID-2026-9644
Project Name	Implement Client Script & UI Policy (Incident)
Team Size	3
Team Leader	Vairavakarumari A
Team Member	Abinaya K
Team Member	Kayathri Devi B

Step 1: Team Gathering, Collaboration and Select the Problem Statement

The team discussed common challenges in Incident management, especially the inconsistent and incomplete data entry that occurs when users rely only on awareness and manual checks. The team identified the need to enforce data integrity directly at the user interface level using ServiceNow UI Policies and Client Scripts.

Problem Statement: Incident records require consistent and accurate data for effective triage, routing, and resolution. Relying on manual checks can lead to incomplete, inconsistent, or incorrect data, which affects reporting accuracy, SLA compliance, and service quality. UI Policies and Client Scripts can control field visibility, mandatory status, and save-time validation so that Incident records meet defined business rules before submission.

Step 2: Brainstorm, Idea Listing and Grouping

- Make fields mandatory dynamically using UI Policies based on conditions.
- Show or hide Incident fields depending on the selected values.
- Auto-populate field values using Client Scripts.
- Validate data on form save and prevent submission when conditions are not met.
- Improve data quality, consistency, and reporting accuracy.

Step 3: Idea Prioritization

Priority	Idea	Priority Level
1	Implement UI Policies to make fields mandatory	High
2	Implement Client Script for save-time validation	High
3	Auto-populate values using Client Scripts	Medium
4	Control field visibility and behavior	Medium
5	Improve Incident data quality and consistency	High

Project Focus: Use ServiceNow UI Policies and Client Scripts to enforce data integrity on Incident records by controlling field behavior and validating data before submission.
